Intermittent hypoxia may boost ankle strength and walking in MS.

Why this matters: A randomized, double-masked, placebo-controlled crossover trial investigated whether acute intermittent hypoxia improves motor function in people with multiple sclerosis.

Can oropharyngeal exercises help swallowing with limited mouth opening?

Why this matters: A pilot study explored the feasibility and initial effects of oropharyngeal alignment exercise on swallowing function in neurological patients with restricted mouth opening.

Education, BMI, and academy training predict elite distance running.

Why this matters: An observational study identified factors beyond physiology that may contribute to high performance in Ethiopian distance runners.
