Structured rehab with PRP improves short-term pain and function in subacromial pain.

Why this matters: A randomized controlled trial looked at adding a structured post-PRP rehabilitation approach to conventional physiotherapy for subacromial pain syndrome patients.

What control strategies will make lower-extremity exoskeletons more effective?

Why this matters: This review explores how to improve control strategies for lower-extremity exoskeletons used in gait rehabilitation, addressing current limitations like unintuitive interfaces.

Low-frequency deep brain stimulation may aid long-term orofacial recovery post-TBI.

Why this matters: A case study investigated if low-frequency deep brain stimulation could help a patient with chronic dysarthria and dysphagia after a traumatic brain injury.
