Timing of ACL surgery impacts long-term walking mechanics.

Why this matters: This systematic review found that delayed ACL reconstruction is linked to persistent sagittal plane deficits during walking.

Can biofeedback reduce knee abduction angle in ACL injury prevention?

Why this matters: This systematic review suggests biofeedback may reduce peak knee abduction angle in ACL injury prevention, but evidence certainty is low.

A standard multidisciplinary program for low back pain can be more cost-effective.

Why this matters: This retrospective cohort study found a standard multidisciplinary pathway was more cost-effective than a federal-funded pathway for low back pain.

IMU-based gait analysis can objectively assess vestibular rehabilitation progress.

Why this matters: This observational study found IMU sensors, even single ones, can capture significant improvements in gait after vestibular rehabilitation.

Use the same digital handgrip dynamometer to track patient progress.

Why this matters: This study found that different digital handgrip dynamometers have excellent reliability but are not interchangeable due to systematic differences.
